SUMMARY

Full-stack software engineer with 3+ years shipping production Java and Python backend systems and RESTful APIs on AWS, Azure. Builds modern AI/ML systems end to end: multi-agent orchestration, LLM security and evaluation infrastructure, and generative AI features. Strong in relational databases, RBAC/security design, automated testing, and AI-assisted development.

PROFESSIONAL EXPERIENCE

AI Engineer | **IpserLab LLC** | Boston, MA

Aug 2025 – Jun 2026

- Built Java backend service with 19-table PostgreSQL schema and 4-role RBAC middleware, enforcing data integrity across all API surfaces.
- Hardened 3 third-party API integrations with circuit-breaker retry and scoped JWT credential management, sustaining 99% uptime and eliminating unauthorized access.
- Shipped GitHub Actions CI/CD with Docker containerization and automated regression test gates across 2 production services, cutting defect detection time 55%.
- Operated services on Azure and GCP with Redis caching and structured observability, sustaining p95 latency under 1,500ms and 99% SLA.
- Drove system design reviews and technical documentation across 2 services, using Claude Code and AI-assisted tooling daily in production development.

Software Engineer | **TechVizor** | Gujarat, India

May 2021 – Jul 2023

- Contracted across 5 enterprise clients in fintech, e-commerce, pharma, and telecom, engineering Java/Spring Boot distributed cloud services, PySpark data pipelines, fraud detection microservices, and high-concurrency REST APIs; cumulative outcomes included 15K RPS throughput, 99.99% uptime, sub-50ms inference, and 22–40% efficiency gains.
- Infosys (Client):** Built Java/Spring Boot fraud detection microservice and REST API processing 2M+ monthly SQL transactions at sub-50ms latency, improving detection 18% via relational schema design and feature engineering on financial data, validated through automated regression tests.
- Reliance/JioMart (Client):** Scaled Java/Spring Boot distributed session APIs to 15K concurrent RPS at peak load; designed relational data schema and optimized a PySpark ETL pipeline across distributed multi-tier infrastructure, cutting batch processing time 35% and easing cross-team debugging.
- ICICI Bank (Client):** Decomposed a monolithic Java payment gateway into decoupled Spring Boot microservices with independent failure domains for cross-bank interoperability; automated SQL extraction and schema validation pipelines, cutting data-gather time 40%.

PROJECTS

CORDON – Java Security Proxy for LLM Agent Tool Calls | Java, Gradle, MCP, JSON-RPC, AgentDojo

- Built Java MCP proxy with capability-based policy gate enforcing least privilege across LLM agent tool calls; 424+ tests passing.
- Designed label lattice with property-based tests proving lattice laws; enforcement blocked a planted injection, benign tasks unaffected.
- Wired proxy into AgentDojo benchmark harness via JSON-RPC sidecar to evaluate policy enforcement against real LLM agent security attacks.

Project Ares – Multi-Agent Execution Platform | Python, LangGraph, LangChain, Next.js/TypeScript

- Built a multi-agent system with LangGraph and LangChain: goal-to-DAG compilation, ReAct tool-calling workers, and parallel execution.
- Owned eval infra: built an LLM-as-judge critic agent scoring factual grounding and goal completion, auto-flagging failures into an eval set.
- Designed a pluggable tool interface and Next.js/TypeScript frontend, streaming live agent execution via FastAPI SSE.

TECHNICAL SKILLS

Languages: Java, Python, TypeScript, SQL

AI & Agentic Systems: LangChain, LangGraph, prompt engineering, LLM evaluation & security, Claude Code

Backend & Databases: Spring Boot, FastAPI, React, PostgreSQL, MongoDB, Snowflake

Systems & Architecture: Distributed systems, microservices, REST APIs, async/concurrency, system design

Tools & Cloud: AWS, Azure, GCP, Docker, Git, Linux, GitHub Actions, Prometheus, Airflow

EDUCATION

Master of Science – Information Systems, Northeastern University | Boston, MA

Sept 2023 - May 2025
